

APPLICATION NOTE

AN_263

FT_App_Gauges

Version 1.1

Document Reference No.: FT_000908

Issue Date: 2013-11-01

This document is to introduce the Gauges Demo Application. The objective of the Demo Application is to enable users to become familiar with the usage of the FT800, the design flow, and display list used to design the desired user interface or visual effect

Use of FTDI devices in life support and/or safety applications is entirely at the user's risk, and the user agrees to defend, indemnify and hold FTDI harmless from any and all damages, claims, suits or expense resulting from such use.

1 Introduction

This application demonstrates interactive gauges using rectangles, lines and custom fonts for the numeric display offering a display with 2 digit precision on an FT800 platform.

On WQVGA displays, two gauges are used for demonstration purposes. One gauge displays randomly generated data while the other displays resistance based on how firmly the touch screen is pressed.

On QVGA displays only one gauge is used to display resistance, based on how firmly the touch screen is pressed.

Overview

The application will be useful to understand the FT800 command sets for custom fonts, and FT800 primitives for lines and rectangles.

The application note should be read in conjunction with the source cod, which can be found in section 4 and at http://www.ftdichip.com/Support/SoftwareExamples/FT800_Projects.htm.

Scope

This document can be used as a guide by designers to develop GUI applications by using FT800 with any MCU via SPI or I²C. Note detailed documentation is available on www.ftdichip.com/EVE.htm including:

- [FT800 datasheet](#)
- [Programming Guide covering EVE command language](#)
- [AN_240 FT800 From the Ground Up](#)
- [AN_245 VM800CB SampleApp_PC Introduction](#) - covering detailed design flow with a PC and USB to SPI bridge cable
- [AN_246 VM800CB SampleApp_Arduino Introduction](#) – covering detailed design flow in an Arduino platform
- [AN_252 FT800 Audio Primer](#)

2 Display Requirements

This section describes some of the key components of the design.

BackGround

The display background is created to show a plain dark grey that the gauges will contrast against.

Analogue Gauges

The analogue gauges will display a random value or the resistance in relation to the touch pressure on the screen. The scale markings are coloured green for 0 to 60, yellow for 60 to 80 and red for 80 to 90.

Numeric Gauges

Numeric gauges will display the same value as the analogue gauges but as decimal numbers using the custom font loaded at the start of the application.

3 Design Flow

Every EVE design follows the same basic principles as highlighted in Figure 3.1.

Select and configure your host port for controlling the FT800 then wake the device before configuring the display. The creative part then revolves around the generation of the display list. There will be two lists. The active list and the updated/next list are continually swapped to render the display. Note, header files map the pseudo code of the design file of the display list to the FT800 instruction set, which is sent as the data of the SPI (or I²C) packet (typically <1KB). As a result, with EVE's object oriented approach, the FT800 is operating as an SPI peripheral while providing full display, audio, and touch capabilities.

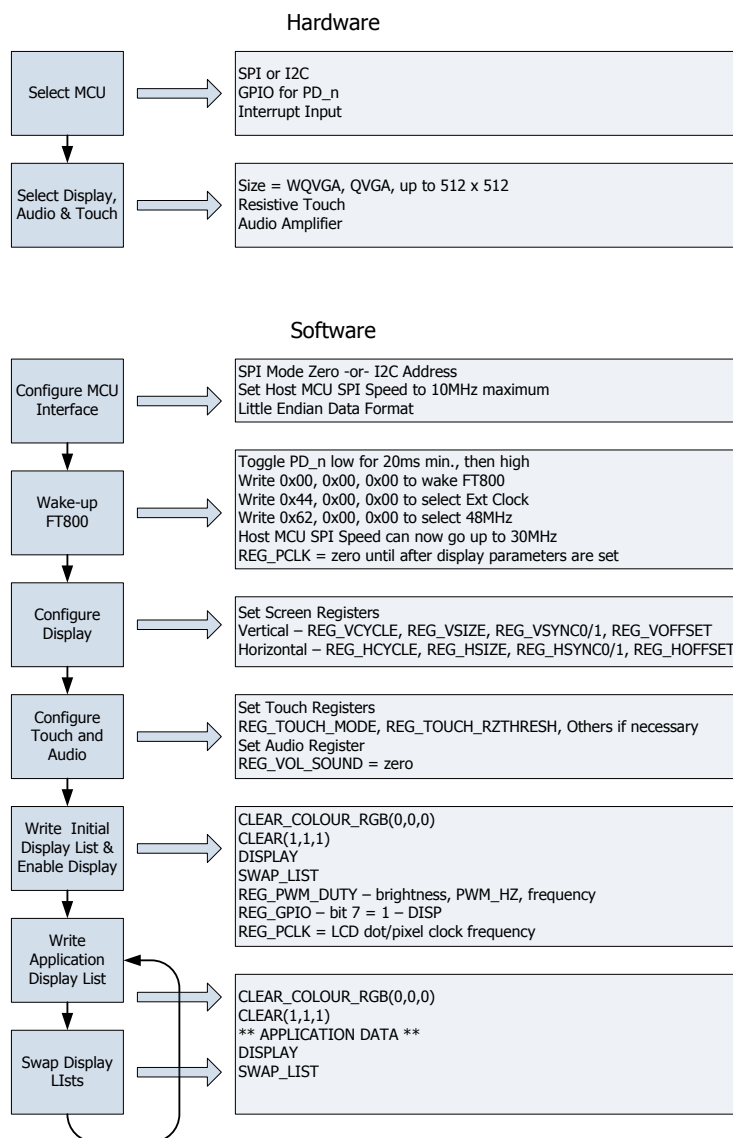

Figure 3.1 Generic EVE Design Flow

Gauges Flowchart

The flow chart below is specific to the Gauges application. Custom fonts are loaded into the Graphics RAM for use with the numeric display. The display background is then generated for display. Touch pressure is read and converted to a display value on one gauge while the other uses a randomly generated number. The program then operates in a loop to update the display list.

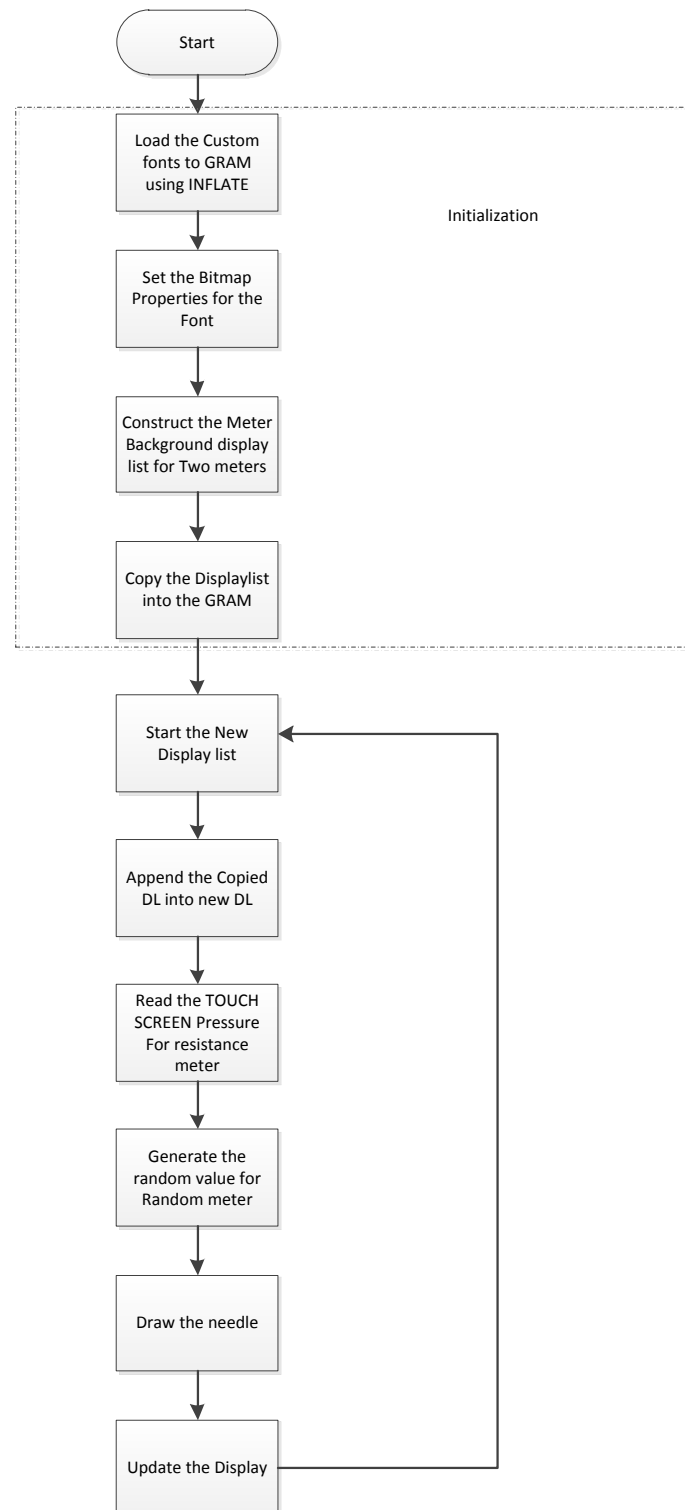

Figure 3.2 Flowchart

4 Description of the Functional Blocks

System Initialisation

Configuration of the SPI master port is unique to each controller – different registers etc, but all will require data to be sent Most Significant Bit (MSB) first with a little endian format.

The function labelled Ft_BootupConfig in this project is generic to all applications and will start by toggling the FT800 PD# pin to perform a power cycle.

```
/* Do a power cycle for safer side */
Ft_Gpu_Hal_Powercycle(phost, FT_TRUE);
Ft_Gpu_Hal_Rd16(phost, RAM_G);

/* Set the clk to external clock */
Ft_Gpu_HostCommand(phost, FT_GPU_EXTERNAL_OSC);
Ft_Gpu_Hal_Sleep(10);

/* Switch PLL output to 48MHz */
Ft_Gpu_HostCommand(phost, FT_GPU_PLL_48M);
Ft_Gpu_Hal_Sleep(10);

/* Do a core reset for safer side */
Ft_Gpu_HostCommand(phost, FT_GPU_CORE_RESET);

/* Access address 0 to wake up the FT800 */
Ft_Gpu_HostCommand(phost, FT_GPU_ACTIVE_M);
```

The internal PLL is then given a prompt by setting the clock register and PLL to 48 MHz.

Note 36MHz is possible but will have a knock on effect for the display timing parameters.

A software reset of the core is performed followed by a dummy read to address 0 to complete the wake up sequence.

The FT800 GPIO lines are also controlled by writing to registers:

```
Ft_Gpu_Hal_Wr8(phost, REG_GPIO_DIR, 0x80 | Ft_Gpu_Hal_Rd8(phost, REG_GPIO_DIR));
Ft_Gpu_Hal_Wr8(phost, REG_GPIO, 0x080 | Ft_Gpu_Hal_Rd8(phost, REG_GPIO));
```

And these allow the display to be enabled.

To confirm the FT800 is awake and ready to start accepting display list information the identity register is read in a loop until it reports back 0x7C. It will always be 0x7C if everything is awake and functioning correctly.

```
ft_uint8_t chipid;
//Read Register ID to check if FT800 is ready.
chipid = Ft_Gpu_Hal_Rd8(phost, REG_ID);
while(chipid != 0x7C)
    chipid = Ft_Gpu_Hal_Rd8(phost, REG_ID);
```

Once the FT800 is awake the display may be configured through 13 register writes according to its resolution. Resolution and timing data should be available in the display datasheet.

```

Ft_Gpu_Hal_Wr16(phost, REG_HCYCLE, FT_DispHCycle);
Ft_Gpu_Hal_Wr16(phost, REG_HOFFSET, FT_DispHOffset);
Ft_Gpu_Hal_Wr16(phost, REG_HSYNC0, FT_DispHSync0);
Ft_Gpu_Hal_Wr16(phost, REG_HSYNC1, FT_DispHSync1);
Ft_Gpu_Hal_Wr16(phost, REG_VCYCLE, FT_DispVCycle);
Ft_Gpu_Hal_Wr16(phost, REG_VOFFSET, FT_DispVOffset);
Ft_Gpu_Hal_Wr16(phost, REG_VSYNC0, FT_DispVSync0);
Ft_Gpu_Hal_Wr16(phost, REG_VSYNC1, FT_DispVSync1);
Ft_Gpu_Hal_Wr8(phost, REG_SWIZZLE, FT_DispSwizzle);
Ft_Gpu_Hal_Wr8(phost, REG_PCLK_POL, FT_DispPCLKPol);
Ft_Gpu_Hal_Wr8(phost, REG_PCLK, FT_DispPCLK); //after this display is visible on the
LCD
Ft_Gpu_Hal_Wr16(phost, REG_HSIZE, FT_DispWidth);
Ft_Gpu_Hal_Wr16(phost, REG_VSIZE, FT_DispHeight);

```

To complete the configuration the touch controller should also be calibrated

```

/* Touch configuration - configure the resistance value to 1200 - this value is
specific to customer requirement and derived by experiment */

```

```

Ft_Gpu_Hal_Wr16(phost, REG_TOUCH_RZTHRESH, 1200);
Ft_Gpu_Hal_Wr8(phost, REG_GPIO_DIR, 0xff);
Ft_Gpu_Hal_Wr8(phost, REG_GPIO, 0x0ff);

```

An optional step is present in this code to clear the screen so that no artefacts from bootup are displayed.

```

/*It is optional to clear the screen here*/
Ft_Gpu_Hal_WrMem(phost, RAM_DL, (ft_uint8_t
                                *)FT_DLCODE_BOOTUP, sizeof(FT_DLCODE_BOOTUP));
Ft_Gpu_Hal_Wr8(phost, REG_DLSWAP, DLSWAP_FRAME);

```

Info()

This is a largely informational section of code and it starts by synchronising the physical xy coordinates of the displays touch layer with the displays visual layer.

A display list is started and cleared:

```

Ft_Gpu_CoCmd_Dlstart(phost);
Ft_App_WrCoCmd_Buffer(phost, CLEAR(1,1,1));
Ft_App_WrCoCmd_Buffer(phost, COLOR_RGB(255,255,255));

```

A text instruction is printed on the display followed by the call to the internal calibrate function:

```

Ft_Gpu_CoCmd_Text(phost, FT_DispWidth/2, FT_DispHeight/2, 26, OPT_CENTERX|OPT_CENTERY, "
Please tap on a dot");
Ft_Gpu_CoCmd_Calibrate(phost, 0);

```

The display list is then terminated and swapped to allow the changes to take effect.

```

Ft_App_WrCoCmd_Buffer(phost, DISPLAY());
Ft_Gpu_CoCmd_Swap(phost);
Ft_App_Flush_Co_Buffer(phost);
Ft_Gpu_Hal_WaitCmdfifo_empty(phost);

```

Next up in the Info() function is the FTDI logo playback:

```
Ft_Gpu_CoCmd_Logo(phost);
Ft_App_Flush_Co_Buffer(phost);
Ft_Gpu_Hal_WaitCmdfifo_empty(phost);
while(0!=Ft_Gpu_Hal_Rd16(phost,REG_CMD_READ));
dloffset = Ft_Gpu_Hal_Rd16(phost,REG_CMD_DL);
dloffset -=4;
Ft_Gpu_Hal_WrCmd32(phost,CMD_MEMCPY);
Ft_Gpu_Hal_WrCmd32(phost,100000L);
Ft_Gpu_Hal_WrCmd32(phost,RAM_DL);
Ft_Gpu_Hal_WrCmd32(phost,dloffset);
play_setup();
```

A composite image with the logo and a start arrow is then displayed to allow the user to start the main application

```
do
{
  Ft_Gpu_CoCmd_Dlstart(phost);
  Ft_Gpu_CoCmd_Append(phost,100000L,dloffset);
  Ft_App_WrCoCmd_Buffer(phost,BITMAP_TRANSFORM_A(256));
  Ft_App_WrCoCmd_Buffer(phost,BITMAP_TRANSFORM_A(256));
  Ft_App_WrCoCmd_Buffer(phost,BITMAP_TRANSFORM_B(0));
  Ft_App_WrCoCmd_Buffer(phost,BITMAP_TRANSFORM_C(0));
  Ft_App_WrCoCmd_Buffer(phost,BITMAP_TRANSFORM_D(0));
  Ft_App_WrCoCmd_Buffer(phost,BITMAP_TRANSFORM_E(256));
  Ft_App_WrCoCmd_Buffer(phost,BITMAP_TRANSFORM_F(0));
  Ft_App_WrCoCmd_Buffer(phost,SAVE_CONTEXT());
  Ft_App_WrCoCmd_Buffer(phost,COLOR_RGB(219,180,150));
  Ft_App_WrCoCmd_Buffer(phost,COLOR_A(220));
  Ft_App_WrCoCmd_Buffer(phost,BEGIN(EDGE_STRIP_A));
  Ft_App_WrCoCmd_Buffer(phost,VERTEX2F(0,FT_DispHeight*16));
  Ft_App_WrCoCmd_Buffer(phost,VERTEX2F(FT_DispWidth*16,FT_DispHeight*16));
  Ft_App_WrCoCmd_Buffer(phost,COLOR_A(255));
  Ft_App_WrCoCmd_Buffer(phost,RESTORE_CONTEXT());
  Ft_App_WrCoCmd_Buffer(phost,COLOR_RGB(0,0,0));
  // INFORMATION
  Ft_Gpu_CoCmd_Text(phost,FT_DispWidth/2,20,28,OPT_CENTERX|OPT_CENTERY,info[0]);
  Ft_Gpu_CoCmd_Text(phost,FT_DispWidth/2,60,26,OPT_CENTERX|OPT_CENTERY,info[1]);
  Ft_Gpu_CoCmd_Text(phost,FT_DispWidth/2,90,26,OPT_CENTERX|OPT_CENTERY,info[2]);
  Ft_Gpu_CoCmd_Text(phost,FT_DispWidth/2,120,26,OPT_CENTERX|OPT_CENTERY,info[3]);
  Ft_Gpu_CoCmd_Text(phost,FT_DispWidth/2,FT_DispHeight-
30,26,OPT_CENTERX|OPT_CENTERY,"Click to play");
  if(sk!='P')
  Ft_App_WrCoCmd_Buffer(phost,COLOR_RGB(255,255,255));
  else
  Ft_App_WrCoCmd_Buffer(phost,COLOR_RGB(100,100,100));
  Ft_App_WrCoCmd_Buffer(phost,BEGIN(FTPOINTS));
  Ft_App_WrCoCmd_Buffer(phost,POINT_SIZE(20*16));
  Ft_App_WrCoCmd_Buffer(phost,TAG('P'));
  Ft_App_WrCoCmd_Buffer(phost,VERTEX2F((FT_DispWidth/2)*16,(FT_DispHeight-60)*16));
  Ft_App_WrCoCmd_Buffer(phost,COLOR_RGB(180,35,35));
  Ft_App_WrCoCmd_Buffer(phost,BEGIN(BITMAPS));
  Ft_App_WrCoCmd_Buffer(phost,VERTEX2II((FT_DispWidth/2)-14,(FT_DispHeight-
75),14,0));
  Ft_App_WrCoCmd_Buffer(phost,DISPLAY());
  Ft_Gpu_CoCmd_Swap(phost);
  Ft_App_Flush_Co_Buffer(phost);
  Ft_Gpu_Hal_WaitCmdfifo_empty(phost);
}while(Read_Keys()!='P');
```

Loading the Font

The font table is hard coded in the application as an array labelled "digits". This array is loaded into graphics RAM at the start of the "Gauges" function with the CMD_INFLATE command:

```
Ft_Gpu_CoCmd_MemSet(phost,0,0,10*1024);
Ft_App_Flush_Co_Buffer(phost);
Ft_Gpu_Hal_WaitCmdfifo_empty(phost);

Ft_Gpu_Hal_WrCmd32(phost,CMD_INFLATE);
Ft_Gpu_Hal_WrCmd32(phost,0);
WRITE2CMD(digits);
```

The first 32 Characters are unwanted so based on the width and height of the font the bitmap source is skipped.

```
Ft_Gpu_CoCmd_Dlstart(phost);
Ft_Gpu_CoCmd_SetFont(phost,13,0);
Ft_App_WrCoCmd_Buffer(phost,BITMAP_HANDLE(13));
Ft_App_WrCoCmd_Buffer(phost,BITMAP_SOURCE(144 - (32L*(54/2)*87)));
Ft_App_WrCoCmd_Buffer(phost,BITMAP_LAYOUT(L4, 54/2,87));
Ft_App_WrCoCmd_Buffer(phost,BITMAP_SIZE(NEAREST, BORDER, BORDER, 54, 87));
Ft_App_WrCoCmd_Buffer(phost,DISPLAY());
Ft_Gpu_CoCmd_Swap(phost);
Ft_App_Flush_Co_Buffer(phost);
Ft_Gpu_Hal_WaitCmdfifo_empty(phost);
```

Note: After these configurations are set, swap the display list and flush into the J1 Memory. Wait for J1 Idle by using REG_CMD_WRITE and REG_CMD_READ registers

Creating the Basic Gauge

Active areas are cut in the background for each gauge with the scissors function. Each gauge image is static, but the needle is continually updated.

```
Ft_Gpu_CoCmd_Dlstart(phost);
Ft_App_WrCoCmd_Buffer(phost,CLEAR_COLOR_RGB(55,55,55));
Ft_App_WrCoCmd_Buffer(phost,CLEAR(1,1,1));
Ft_App_WrCoCmd_Buffer(phost,CLEAR_COLOR_RGB(0,0,0));
```

```
y = 10;
for(z=0;z<(FT_DispWidth/w);z++)
{
  ox = 240*z;
  Ft_App_WrCoCmd_Buffer(phost,SCISSOR_XY(ox+dt,y));
  Ft_App_WrCoCmd_Buffer(phost,SCISSOR_SIZE(w,h));
  Ft_App_WrCoCmd_Buffer(phost,CLEAR(1,1,1));
```

Coloured lines of different width mark the gauge scale. The "cs" function is used to define the colour in a separate function.

```
Ft_App_WrCoCmd_Buffer(phost,BEGIN(LINES));
Ft_App_WrCoCmd_Buffer(phost,LINE_WIDTH(10));
for (bi = 0; bi < 81; bi += 10)
{
  cs(bi);
  for ( i = 2; i < 10; i += 2)
  {
```

```

        a = da(bi + i);
        polar(220, a);
        polar(240, a);
    }
}

Ft_App_WrCoCmd_Buffer(phost, LINE_WIDTH(16));
for (i = 0; i < 91; i += 10)
{
    cs(i);
    a = da(i);
    polar(220, a);
    polar(250, a);
}

```

White text to explain the gauge function is also applied.

```

Ft_App_WrCoCmd_Buffer(phost, COLOR_RGB(255,255,255));
for (i = 0; i < 91; i += 10)
{
    a = da(i);
    polarxy(260, a, &tx, &ty);
    Ft_Gpu_CoCmd_Number(phost, tx >> 4, ty >> 4, 26, OPT_CENTER, i);
}
ox = (FT_DispWidth/(2*noofch))+(z*(FT_DispWidth/2));

if(z==1)Ft_Gpu_CoCmd_Text(phost, ox, h-10, 28, OPT_CENTERX, "Random");
if(z==0)Ft_Gpu_CoCmd_Text(phost, ox, h-10, 28, OPT_CENTERX, "Resistance");
}

```

Updating the Display

Updating the gauge displaying "random" data just uses the c code random function.

```

{
    int d = (tgt - rval) / 16;
    rval += d;
    if (ft_random(60) == 0)
        tgt = ft_random(9000L);
    val = rval;
}

```

The resistance function relies on reading the touch register REG_TOUCH_RZ which stores the resistance change when the display is touched.

```

val = Ft_Gpu_Hal_Rd16(phost, REG_TOUCH_RZ);
val = 10*min(899, val);

```

Both the graphical and numerical displays are updated.

```

Ft_App_WrCoCmd_Buffer(phost, SCISSOR_XY(ox+dt, 10));
Ft_App_WrCoCmd_Buffer(phost, SCISSOR_SIZE(w, 120));
Ft_App_WrCoCmd_Buffer(phost, COLOR_RGB(255,255,255));
Ft_App_WrCoCmd_Buffer(phost, BEGIN(LINES));
Ft_App_WrCoCmd_Buffer(phost, LINE_WIDTH(10));
th = (val - 4500L) * 32768L / 36000L;
for (o = -5; o < 6; o++)
{

```

```
polar(170, th + (o << 5));  
polar(235, th);  
}  
Ft_App_WrCoCmd_Buffer(phost, SCISSOR_XY(ox+dt,y));  
Ft_App_WrCoCmd_Buffer(phost, SCISSOR_SIZE(w, (ft_uint16_t)(FT_DispHeight*0.36)));  
Ft_App_WrCoCmd_Buffer(phost, CLEAR(1,1,1));  
Ft_App_WrCoCmd_Buffer(phost, COLOR_RGB(255,0,0));  
Ft_Gpu_CoCmd_Number(phost, ox+dt+10, 160, 13, 2, val/100);  
Ft_Gpu_CoCmd_Text(phost, ox+dt+96, 160, 13, 0, ".");  
Ft_Gpu_CoCmd_Number(phost, ox+dt+106, 160, 13, 2, val%100);  
}  
Ft_App_WrCoCmd_Buffer(phost, DISPLAY());  
Ft_Gpu_CoCmd_Swap(phost);  
Ft_App_Flush_Co_Buffer(phost);  
Ft_Gpu_Hal_WaitCmdfifo_empty(phost);
```

5 Operation

When the user compiles and runs the application code the first screen will be the calibration screen where the user must tap the screen in 3 places to align the touch and the display layers.

Figure 5.1 Tap Screen

This is followed by the logo and the composite logo/information screen which gives a short description of what the application does.

Figure 5.2 Composite screen

After pressing "Click to Play" the app displays the gauges.

Figure 5.3 Gauges
